# WebHDFS REST API

# **Table of contents**

1 Document Conventions	4
2 Introduction	4
2.1 Operations	4
2.2 FileSystem URIs vs HTTP URLs	5
2.3 HDFS Configuration Options	5
3 Authentication	5
4 Proxy Users	6
5 File and Directory Operations	6
5.1 Create and Write to a File	6
5.2 Append to a File	7
5.3 Open and Read a File	8
5.4 Make a Directory	8
5.5 Rename a File/Directory	9
5.6 Delete a File/Directory	9
5.7 Status of a File/Directory	9
5.8 List a Directory	10
6 Other File System Operations	11
6.1 Get Content Summary of a Directory	
6.2 Get File Checksum	12
6.3 Get Home Directory	12
6.4 Set Permission.	
6.5 Set Owner	13
6.6 Set Replication Factor	13
6.7 Set Access or Modification Time	14

7 Delegation Token Operations	14
7.1 Get Delegation Token	14
7.2 Renew Delegation Token	14
7.3 Cancel Delegation Token	15
8 Error Responses	15
8.1 HTTP Response Codes	15
9 JSON Schemas	17
9.1 Boolean JSON Schema.	17
9.2 ContentSummary JSON Schema	17
9.3 FileChecksum JSON Schema	18
9.4 FileStatus JSON Schema	19
9.5 FileStatuses JSON Schema	21
9.6 Long JSON Schema.	21
9.7 Path JSON Schema	21
9.8 RemoteException JSON Schema	22
9.9 Token JSON Schema	22
10 HTTP Query Parameter Dictionary	23
10.1 Access Time	23
10.2 Block Size	23
10.3 Buffer Size	24
10.4 Delegation	24
10.5 Destination	24
10.6 Do As	25
10.7 Group	25
10.8 Length	25
10.9 Modification Time	26
10.10 Offset	26
10.11 <b>Op</b>	26
10.12 Overwrite	27

#### WebHDFS REST API

10.13 Owner	27
10.14 Permission	27
10.15 Recursive	28
10.16 Renewer	
10.17 Replication	
10.18 Token	
10.19 Username	

#### 1. Document Conventions

Monospaced	Used for commands, HTTP request and responses and code blocks.
<monospaced></monospaced>	User entered values.
[Monospaced]	Optional values. When the value is not specified, the default value is used.
Italics	Important phrases and words.

#### 2. Introduction

The HTTP REST API supports the complete FileSystem interface for HDFS. The operations and the corresponding FileSystem methods are shown in the next section. The Section HTTP Query Parameter Dictionary specifies the parameter details such as the defaults and the valid values.

### 2.1. Operations

- HTTP GET
  - OPEN (see FileSystem.open)
  - GETFILESTATUS (see FileSystem.getFileStatus)
  - LISTSTATUS (see FileSystem.listStatus)
  - GETCONTENTSUMMARY (see FileSystem.getContentSummary)
  - GETFILECHECKSUM (see FileSystem.getFileChecksum)
  - GETHOMEDIRECTORY (see FileSystem.getHomeDirectory)
  - GETDELEGATIONTOKEN (see FileSystem.getDelegationToken)

#### HTTP PUT

- <u>CREATE</u> (see <u>FileSystem.create</u>)
- MKDIRS (see FileSystem.mkdirs)
- RENAME (see FileSystem.rename)
- <u>SETREPLICATION</u> (see <u>FileSystem.setReplication</u>)
- <u>SETOWNER</u> (see <u>FileSystem.setOwner</u>)
- SETPERMISSION (see FileSystem.setPermission)
- SETTIMES (see FileSystem.setTimes)
- RENEWDELEGATIONTOKEN (see DistributedFileSystem.renewDelegationToken)
- <u>CANCELDELEGATIONTOKEN</u> (see DistributedFileSystem.cancelDelegationToken)

#### HTTP POST

• APPEND (see FileSystem.append)

#### HTTP DELETE

• DELETE (see FileSystem.delete)

## 2.2. FileSystem URIs vs HTTP URLs

The FileSystem scheme of WebHDFS is "webhdfs://". A WebHDFS FileSystem URI has the following format.

```
webhdfs://<HOST>:<HTTP_PORT>/<PATH>
```

The above WebHDFS URI corresponds to the below HDFS URI.

```
hdfs://<HOST>:<RPC_PORT>/<PATH>
```

In the REST API, the prefix "/webhdfs/v1" is inserted in the path and a query is appended at the end. Therefore, the corresponding HTTP URL has the following format.

http://<HOST>:<HTTP\_PORT>/webhdfs/v1/<PATH>?op=...

# 2.3. HDFS Configuration Options

Below are the HDFS configuration options for WebHDFS.

Property Name	Description
dfs.webhdfs.enabled	Enable/disable WebHDFS in Namenodes and Datanodes
dfs.web.authentication.kerberos.princ	The HTTP Kerberos principal used by Hadoop-Auth in the HTTP endpoint. The HTTP Kerberos principal MUST start with 'HTTP/' per Kerberos HTTP SPENGO specification.
dfs.web.authentication.kerberos.keyta	The Kerberos keytab file with the credentials for the HTTP Kerberos principal used by Hadoop-Auth in the HTTP endpoint.

### 3. Authentication

When security is *off*, the authenticated user is the username specified in the user.name query parameter. If the user.name parameter is not set, the server may either set the authenticated user to a default web user, if there is any, or return an error response.

When security is *on*, authentication is performed by either Hadoop delegation token or Kerberos SPNEGO. If a token is set in the delegation query parameter, the authenticated

user is the user encoded in the token. If the delegation parameter is not set, the user is authenticated by Kerberos SPNEGO.

Below are examples using the curl command tool.

1. Authentication when security is off:

```
curl -i
"http://<HOST>:<PORT>/webhdfs/v1/<PATH>?[user.name=<USER>&]op=..."
```

2. Authentication using Kerberos SPNEGO when security is on:

```
curl -i --negotiate -u : "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=..."
```

3. Authentication using Hadoop delegation token when security is on:

```
curl -i
"http://<HOST>:<PORT>/webhdfs/v1/<PATH>?delegation=<TOKEN>&op=..."
```

# 4. Proxy Users

When the proxy user feature is enabled, a proxy user P may submit a request on behalf of another user U. The username of U must be specified in the doas query parameter unless a delegation token is presented in authentication. In such case, the information of both users P and U must be encoded in the delegation token.

1. A proxy request when security is off:

```
curl -i
"http://<HOST>:<PORT>/webhdfs/v1/<PATH>?[user.name=<USER>&]doas=<USER>&op=..."
```

2. A proxy request using Kerberos SPNEGO when security is on:

```
curl -i --negotiate -u :
"http://<HOST>:<PORT>/webhdfs/v1/<PATH>?doas=<USER>&op=..."
```

3. A proxy request using Hadoop delegation token when security is on:

```
curl -i
"http://<HOST>:<PORT>/webhdfs/v1/<PATH>?delegation=<TOKEN>&op=..."
```

# 5. File and Directory Operations

#### 5.1. Create and Write to a File

• Step 1: Submit a HTTP PUT request without automatically following redirects and without sending the file data.

The request is redirected to a datanode where the file data is to be written:

```
HTTP/1.1 307 TEMPORARY_REDIRECT
Location: http://<DATANODE>:<PORT>/webhdfs/v1/<PATH>?op=CREATE...
Content-Length: 0
```

• Step 2: Submit another HTTP PUT request using the URL in the Location header with the file data to be written.

```
curl -i -X PUT -T <LOCAL_FILE>
"http://<DATANODE>:<PORT>/webhdfs/v1/<PATH>?op=CREATE..."
```

The client receives a 201 Created response with zero content length and the WebHDFS URI of the file in the Location header:

```
HTTP/1.1 201 Created
Location: webhdfs://<HOST>:<PORT>/<PATH>
Content-Length: 0
```

**Note** that the reason of having two-step create/append is for preventing clients to send out data before the redirect. This issue is addressed by the "Expect: 100-continue" header in HTTP/1.1; see RFC 2616, Section 8.2.3. Unfortunately, there are software library bugs (e.g. Jetty 6 HTTP server and Java 6 HTTP client), which do not correctly implement "Expect: 100-continue". The two-step create/append is a temporary workaround for the software library bugs.

See also: <u>overwrite</u>, <u>blocksize</u>, <u>replication</u>, <u>permission</u>, <u>buffersize</u>, <u>FileSystem.create</u>

### 5.2. Append to a File

• Step 1: Submit a HTTP POST request without automatically following redirects and without sending the file data.

```
curl -i -X POST "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=APPEND[&buffersize=<INT>]"
```

The request is redirected to a datanode where the file data is to be appended:

```
HTTP/1.1 307 TEMPORARY_REDIRECT
Location: http://<DATANODE>:<PORT>/webhdfs/v1/<PATH>?op=APPEND...
Content-Length: 0
```

• Step 2: Submit another HTTP POST request using the URL in the Location header with the file data to be appended.

```
curl -i -X POST -T <LOCAL_FILE>
"http://<DATANODE>:<PORT>/webhdfs/v1/<PATH>?op=APPEND..."
```

The client receives a response with zero content length:

```
HTTP/1.1 200 OK
Content-Length: 0
```

See the note in the previous section for the description of why this operation requires two steps.

See also: <u>buffersize</u>, <u>FileSystem.append</u>

# 5.3. Open and Read a File

• Submit a HTTP GET request with automatically following redirects.

```
curl -i -L "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=OPEN
[&offset=<LONG>][&length=<LONG>][&buffersize=<INT>]"
```

The request is redirected to a datanode where the file data can be read:

```
HTTP/1.1 307 TEMPORARY_REDIRECT
Location: http://<DATANODE>:<PORT>/webhdfs/v1/<PATH>?op=OPEN...
Content-Length: 0
```

The client follows the redirect to the datanode and receives the file data:

```
HTTP/1.1 200 OK
Content-Type: application/octet-stream
Content-Length: 22
Hello, webhdfs user!
```

See also: offset, length, buffersize, FileSystem.open

#### 5.4. Make a Directory

• Submit a HTTP PUT request.

```
curl -i -X PUT
"http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=MKDIRS[&permission=<OCTAL>]"
```

The client receives a response with a boolean JSON object:

```
HTTP/1.1 200 OK
Content-Type: application/json
Transfer-Encoding: chunked
{"boolean": true}
```

See also: permission, FileSystem.mkdirs

# 5.5. Rename a File/Directory

Submit a HTTP PUT request.

```
curl -i -X PUT
"<HOST>:<PORT>/webhdfs/v1/<PATH>?op=RENAME&destination=<PATH>"
```

The client receives a response with a <u>boolean JSON object</u>:

```
HTTP/1.1 200 OK
Content-Type: application/json
Transfer-Encoding: chunked
{"boolean": true}
```

See also: <u>destination</u>, <u>FileSystem.rename</u>

#### 5.6. Delete a File/Directory

• Submit a HTTP DELETE request.

The client receives a response with a boolean JSON object:

```
HTTP/1.1 200 OK
Content-Type: application/json
Transfer-Encoding: chunked
{"boolean": true}
```

See also: <u>recursive</u>, <u>FileSystem.delete</u>

# 5.7. Status of a File/Directory

• Submit a HTTP GET request.

```
curl -i "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=GETFILESTATUS"
```

The client receives a response with a <u>FileStatus JSON object</u>:

See also: FileSystem.getFileStatus

### 5.8. List a Directory

Submit a HTTP GET request.

```
curl -i "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=LISTSTATUS"
```

The client receives a response with a <u>FileStatuses JSON object</u>:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 427

{
    "FileStatuses":
    {
        "accessTime" : 1320171722771,
        "blockSize" : 33554432,
        "group" : "supergroup",
        "length" : 24930,
        "modificationTime": 1320171722771,
        "owner" : "webuser",
```

```
"pathSuffix" : "a.patch",
    "permission" : "644",
    "replication" : 1,
    "type" : "FILE"

},

"accessTime" : 0,
    "blockSize" : 0,
    "group" : "supergroup",
    "length" : 0,
    "modificationTime": 1320895981256,
    "owner" : "szetszwo",
    "pathSuffix" : "bar",
    "permission" : "711",
    "replication" : 0,
    "type" : "DIRECTORY"
},
...

}
```

See also: FileSystem.listStatus

# 6. Other File System Operations

# 6.1. Get Content Summary of a Directory

Submit a HTTP GET request.

```
curl -i "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=GETCONTENTSUMMARY"
```

The client receives a response with a <u>ContentSummary JSON object</u>:

```
HTTP/1.1 200 OK
Content-Type: application/json
Transfer-Encoding: chunked

{
    "ContentSummary":
    {
        "directoryCount": 2,
        "fileCount" : 1,
        "length" : 24930,
        "quota" : -1,
        "spaceConsumed" : 24930,
        "spaceQuota" : -1
}
}
```

See also: <u>FileSystem.getContentSummary</u>

### 6.2. Get File Checksum

• Submit a HTTP GET request.

```
curl -i "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=GETFILECHECKSUM"
```

The request is redirected to a datanode:

```
HTTP/1.1 307 TEMPORARY_REDIRECT
Location:
http://<DATANODE>:<PORT>/webhdfs/v1/<PATH>?op=GETFILECHECKSUM...
Content-Length: 0
```

The client follows the redirect to the datanode and receives a <u>FileChecksum JSON</u> object:

```
HTTP/1.1 200 OK
Content-Type: application/json
Transfer-Encoding: chunked

{
    "FileChecksum":
      {
          "algorithm": "MD5-of-1MD5-of-512CRC32",
          "bytes" : "eadb10de24aa315748930df6e185c0d ...",
          "length" : 28
      }
}
```

See also: FileSystem.getFileChecksum

#### **6.3. Get Home Directory**

Submit a HTTP GET request.

```
curl -i "http://<HOST>:<PORT>/webhdfs/v1/?op=GETHOMEDIRECTORY"
```

The client receives a response with a <u>Path JSON object</u>:

```
HTTP/1.1 200 OK
Content-Type: application/json
Transfer-Encoding: chunked

{"Path": "/user/szetszwo"}
```

See also: <u>FileSystem.getHomeDirectory</u>

#### **6.4. Set Permission**

• Submit a HTTP PUT request.

```
curl -i -X PUT "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=SETPERMISSION [&permission=<OCTAL>]"
```

The client receives a response with zero content length:

```
HTTP/1.1 200 OK
Content-Length: 0
```

See also: permission, FileSystem.setPermission

#### 6.5. Set Owner

Submit a HTTP PUT request.

```
curl -i -X PUT "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=SETOWNER [&owner=<USER>][&group=<GROUP>]"
```

The client receives a response with zero content length:

```
HTTP/1.1 200 OK
Content-Length: 0
```

See also: <u>owner</u>, <u>group</u>, <u>FileSystem.setOwner</u>

# 6.6. Set Replication Factor

Submit a HTTP PUT request.

The client receives a response with a boolean JSON object:

```
HTTP/1.1 200 OK
Content-Type: application/json
Transfer-Encoding: chunked
{"boolean": true}
```

See also: <u>replication</u>, <u>FileSystem.setReplication</u>

#### 6.7. Set Access or Modification Time

• Submit a HTTP PUT request.

```
curl -i -X PUT "http://<HOST>:<PORT>/webhdfs/v1/<PATH>?op=SETTIMES
[&modificationtime=<TIME>][&accesstime=<TIME>]"
```

The client receives a response with zero content length:

```
HTTP/1.1 200 OK
Content-Length: 0
```

See also: modificationtime, accesstime, FileSystem.setTimes

# 7. Delegation Token Operations

# 7.1. Get Delegation Token

• Submit a HTTP GET request.

```
curl -i
"http://<HOST>:<PORT>/webhdfs/v1/?op=GETDELEGATIONTOKEN&renewer=<USER>"
```

The client receives a response with a <u>Token JSON object</u>:

```
HTTP/1.1 200 OK
Content-Type: application/json
Transfer-Encoding: chunked

{
    "Token":
    {
        "urlString": "JQAIaG9y..."
    }
}
```

See also: <u>renewer</u>, <u>FileSystem.getDelegationToken</u>

#### 7.2. Renew Delegation Token

• Submit a HTTP PUT request.

```
curl -i -X PUT
"http://<HOST>:<PORT>/webhdfs/v1/?op=RENEWDELEGATIONTOKEN&token=<TOKEN>"
```

The client receives a response with a long JSON object:

```
HTTP/1.1 200 OK
Content-Type: application/json
Transfer-Encoding: chunked

{"long": 1320962673997} //the new expiration time
```

See also: <u>token</u>, DistributedFileSystem.renewDelegationToken

### 7.3. Cancel Delegation Token

• Submit a HTTP PUT request.

```
curl -i -X PUT
"http://<HOST>:<PORT>/webhdfs/v1/?op=CANCELDELEGATIONTOKEN&token=<TOKEN>"
The client receives a response with zero content length:
```

```
HTTP/1.1 200 OK
Content-Length: 0
```

See also: <u>token</u>, DistributedFileSystem.cancelDelegationToken

# 8. Error Responses

When an operation fails, the server may throw an exception. The JSON schema of error responses is defined in <u>RemoteException JSON schema</u>. The table below shows the mapping from exceptions to HTTP response codes.

# **8.1. HTTP Response Codes**

Exceptions	HTTP Response Codes
IllegalArgumentException	400 Bad Request
UnsupportedOperationException	400 Bad Request
SecurityException	401 Unauthorized
IOException	403 Forbidden
FileNotFoundException	404 Not Found
RumtimeException	500 Internal Server Error

Below are examples of exception responses.

### 8.1.1. Illegal Argument Exception

```
HTTP/1.1 400 Bad Request
Content-Type: application/json
Transfer-Encoding: chunked

{
    "RemoteException":
    {
        "exception" : "IllegalArgumentException",
        "javaClassName": "java.lang.IllegalArgumentException",
        "message" : "Invalid value for webhdfs parameter \"permission\":
        ..."
    }
}
```

### 8.1.2. Security Exception

```
HTTP/1.1 401 Unauthorized
Content-Type: application/json
Transfer-Encoding: chunked

{
    "RemoteException":
    {
        "exception" : "SecurityException",
        "javaClassName": "java.lang.SecurityException",
        "message" : "Failed to obtain user group information: ..."
    }
}
```

#### 8.1.3. Access Control Exception

```
HTTP/1.1 403 Forbidden
Content-Type: application/json
Transfer-Encoding: chunked

{
    "RemoteException":
    {
        "exception" : "AccessControlException",
        "javaClassName": "org.apache.hadoop.security.AccessControlException",
        "message" : "Permission denied: ..."
    }
}
```

#### 8.1.4. File Not Found Exception

```
HTTP/1.1 404 Not Found
```

```
Content-Type: application/json
Transfer-Encoding: chunked

{
    "RemoteException":
    {
        "exception" : "FileNotFoundException",
        "javaClassName": "java.io.FileNotFoundException",
        "message" : "File does not exist: /foo/a.patch"
    }
}
```

### 9. JSON Schemas

All operations, except for <u>OPEN</u>, either return a zero-length response or a JSON response. For <u>OPEN</u>, the response is an octet-stream. The JSON schemas are shown below. See <u>draft-zyp-json-schema-03</u> for the syntax definitions of the JSON schemas.

#### 9.1. Boolean JSON Schema

See also: MKDIRS, RENAME, DELETE, SETREPLICATION

### 9.2. ContentSummary JSON Schema

```
"required" : true
},
    "fileCount":
{
        "description": "The number of files.",
        "type" : "integer",
        "required" : true
},
        "length":
{
        "description": "The number of bytes used by the content.",
        "type" : "integer",
        "required" : true
},
        "quota":
{
        "description": "The namespace quota of this directory.",
        "type" : "integer",
        "required" : true
},
        "spaceConsumed":
{
        "description": "The disk space consumed by the content.",
        "type" : "integer",
        "required" : true
},
        "spaceQuota":
        {
        "description": "The disk space quota.",
        "type" : "integer",
        "required" : true
},
        "spaceQuota":
        {
        "description": "The disk space quota.",
        "type" : "integer",
        "required" : true
}
}
}
```

See also: GETCONTENTSUMMARY

#### 9.3. FileChecksum JSON Schema

```
{
  "name" : "FileChecksum",
  "properties":
  {
    "type" : "object",
        "properties":
    {
        "algorithm":
        {
            "description": "The name of the checksum algorithm.",
        }
}
```

```
"type" : "string",
    "required" : true
},
    "bytes":
{
    "description": "The byte sequence of the checksum in
hexadecimal.",
    "type" : "string",
    "required" : true
},
    "length":
    {
        "description": "The length of the bytes (not the length of the string).",
        "type" : "integer",
        "required" : true
}
}
}
}
```

See also: GETFILECHECKSUM

#### 9.4. FileStatus JSON Schema

See also: <u>GETFILESTATUS</u>, <u>FileStatus</u>

#### 9.4.1. FileStatus Properties

JavaScript syntax is used to define fileStatusProperties so that it can be referred in both FileStatus and FileStatuses JSON schemas.

```
"blockSize":
   "description": "The block size of a file.",
   "type" : "integer",
"required" : true
 group:
   "description": "The group owner.",
   "type" : "string",
"required" : true
   "type"
},
"length":
   "description": "The number of bytes in a file.",
   "type" : "integer",
"required" : true
 "modificationTime":
   "description": "The modification time.",
  "type" : "integer",
"required" : true
   "description": "The user who is the owner.",
"type" : "string",
"required" : true
   "required"
 "pathSuffix":
   "description": "The path suffix.",
   "type" : "string",
"required" : true
 "permission":
   "description": "The permission represented as a octal string.",
   "type" : "string",
"required" : true
 "replication":
   "description": "The number of replication of a file.",
   "type" : "integer",
"required" : true
"type":
   "description": "The type of the path object.",
"enum" : ["FILE", "DIRECTORY"],
   "required" : true
```

```
}
};
```

#### 9.5. FileStatuses JSON Schema

A FileStatuses JSON object represents an array of FileStatus JSON objects.

See also: LISTSTATUS, FileStatus

### 9.6. Long JSON Schema

```
{
   "name" : "long",
   "properties":
   {
      "long":
      {
         "description": "A long integer value",
         "type" : "integer",
         "required" : true
      }
   }
}
```

See also: <u>RENEWDELEGATIONTOKEN</u>,

# 9.7. Path JSON Schema

See also: GETHOMEDIRECTORY, Path

# 9.8. RemoteException JSON Schema

#### 9.9. Token JSON Schema

```
{
```

See also: <u>GETDELEGATIONTOKEN</u>, the note in <u>Delegation</u>.

# 10. HTTP Query Parameter Dictionary

### 10.1. Access Time

Name	accesstime
Description	The access time of a file/directory.
Туре	long
Default Value	-1 (means keeping it unchanged)
Valid Values	-1 or a timestamp
Syntax	Any integer.

See also: **SETTIMES** 

### 10.2. Block Size

Name	blocksize
Description	The block size of a file.
Туре	long
Default Value	Specified in the configuration.
Valid Values	> 0

See also: <a href="#">CREATE</a>

### 10.3. Buffer Size

Name	buffersize
Description	The size of the buffer used in transferring data.
Туре	int
Default Value	Specified in the configuration.
Valid Values	> 0
Syntax	Any integer.

See also: <u>CREATE</u>, <u>APPEND</u>, <u>OPEN</u>

# 10.4. Delegation

Name	delegation
Description	The delegation token used for authentication.
Туре	String
Default Value	<empty></empty>
Valid Values	An encoded token.
Syntax	See the note below.

Note that delegation tokens are encoded as a URL safe string; see encodeToUrlString() and decodeFromUrlString(String) in org.apache.hadoop.security.token.Token for the details of the encoding.

See also: <u>Authentication</u>

### 10.5. Destination

Name	destination
Description	The destination path used in RENAME.
Туре	Path
Default Value	<empty> (an invalid path)</empty>

Valid Values	An absolute FileSystem path without scheme and authority.
